# Teste Dev Back-end

Problema 01

Criar uma API para disponibilizar os dados para a composição de um dashboard de chamados de suporte conforme protótipo abaixo:

A API deverá receber o mês e o ano como parâmetro e retornar em uma única chamada o seguintes dados:

- Lista de Tickets;
- Dados Agrupados Por Cliente;
- Dados Agrupados Por Módulo.

> ⓘ O agrupamento por cliente e por módulo não deve ser feito via SQL e sim com base na lista recuperada no banco de dados.

A API deve permitir a criação de um Ticket.

Problema 02

Criar uma API que receba um um prato e retorne a lista de receitas encontradas.

As receitas devem ser consultadas na API https://forkify-api.herokuapp.com/api/ passando o prato como parâmetro.

Exemplo de request buscando receitas de pizza:

https://forkify-api.herokuapp.com/api/search?q=pizza
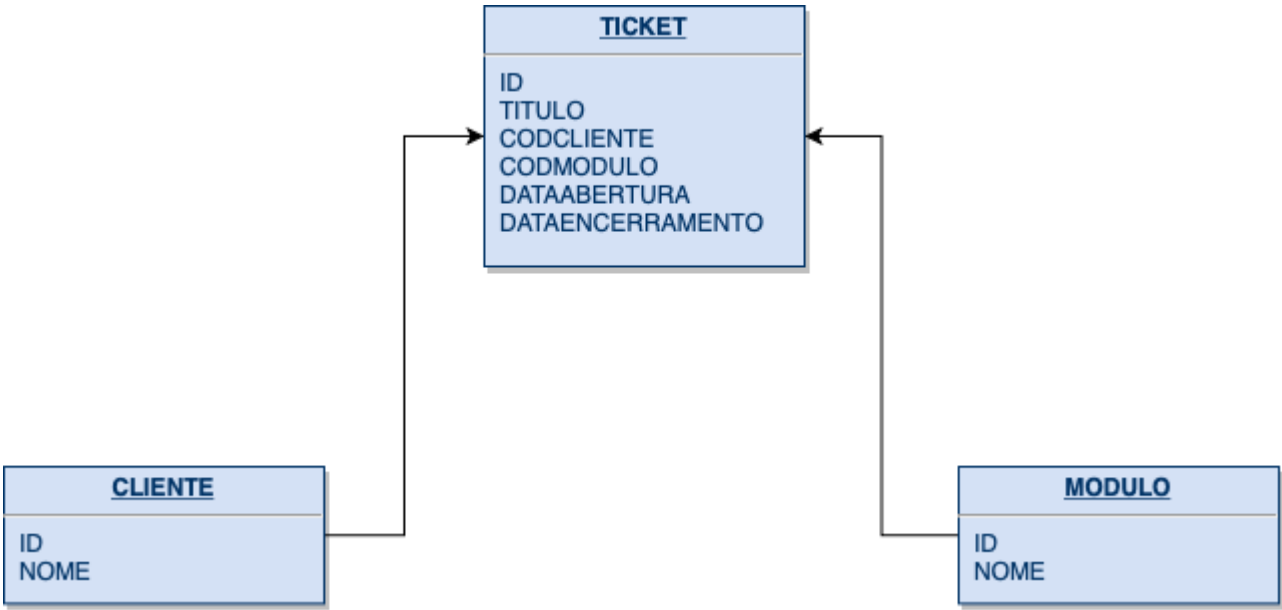

Exemplo retorno:
